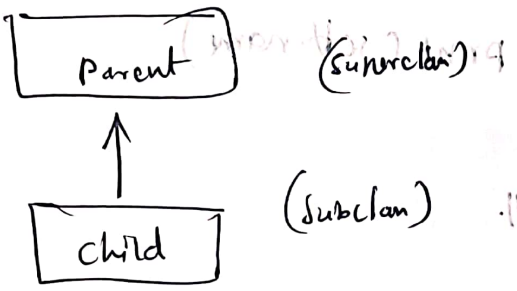
Topic - 10:

Types of inheritance:

1. single inheritance
2. multiple inheritance
3. multilevel inheritance.
4. Hierarchial inheritance.

1. single inheritance

One parent → one child.



```
class A:
    def Parent_method():
        print(" I am parent method")

class B(A):
    def child_method():

        print(" I am child method")

B1 = B();

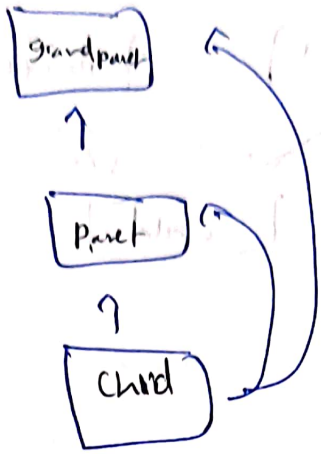
B1.Parent_method()

B1.child_method()
```

Scanned with OKEN Scanner

③ Multilevel Inheritance

one grand parent → one parent → child



[The child can access all the parent & grand parent properties].

```
class A:
    def grand_parent():
        print("I am grand parent method")

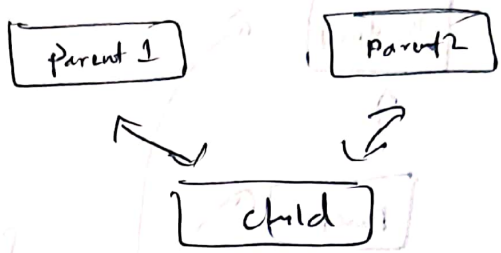
class B(A):
    def parent():
        print("I am parent method")

class C(B):
    def child():
        print("I am child method")

c1 = C();
c.grandparent()
c.parent()
c.child()
```

③ Multiple inheritance:

one child → Multiple parent



```
class A:
    def parent1():
        print("I am parent 1")

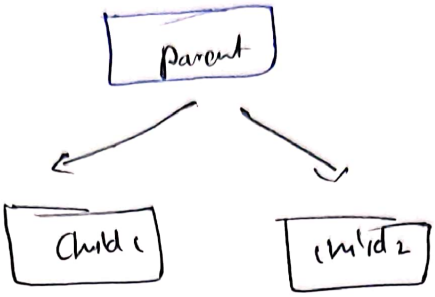
class B:
    def parent2():
        print("I am Parent 2")

class C (A,B):
    def child():
        print("I am child")

c1=C();
c1.parent1()
c1.parent2()
c1.child()
```

(iv) Hierarchal Inheritance:

One parent multiple children



```
class Parent()
    def parent():
        Print(" Iam parent")

def child1(Parent):
    def child1():
        print(" I am child1")

def child2(parent):
    def child2():
        print(" I am child2")

c = child2();
c.child2()
c.parent()
c.child1() # Error//
```
